HAZMAT SAFETY DATA SHEET

0xc2292af8b51109a27a4b4e28e9cf9f3aede4190c (verified as ClausTokenDealEscrow)

Read 11,566 bytes of deployed bytecode and checked it against 16 registered hazards. 3 hazards are present, reproduced against this very contract.

What this is: It is a plain contract on mainnet, read from its bytecode.
What matched: 3 of the 16 registered hazards are present: HZ-001 (ordering), HZ-009 (ordering), HZ-005 (stranded-value).
How sure: HZ-001, HZ-009, HZ-005 were reproduced against this exact contract, not a lookalike.
The sharpest one: HZ-001: A still-valid action is destroyed by a permissionless trigger in the same block
What is at stake: one deal amount, which is the worker's entire payment on the affected deal.
What to do about it: Bound the still-valid exit by the same clock as the permissionless trigger, or document which exit is authoritative after the window.
Also: Define the authoritative exit for the overlap, or bound both paths by the same clock.
Also: Add a sweep for stray value, or document that it is donated.

ASSERTION LEVEL: PATTERN MATCH ONLY; CONFIRMATION RUNS ARE SEPARATE
A match is a candidate, not a clearance: this sheet fingerprints a contract against registered hazard shapes, it does not audit it. A clean sheet is not the same as safe.

ANSWERS TO THE USUAL QUESTIONS
read from the selectors this contract exposes, not from its docs. Every answer says what it cannot tell you.

Did you find any vulnerabilities in the contract?
No audit happened, so "found" is the wrong word. But HZ-001, HZ-005 and HZ-009 are not shapes: the behaviour was reproduced against this exact contract, not a lookalike - a still-valid action is destroyed by a permissionless trigger in the same block. That makes it a demonstrated hazard rather than a candidate; it becomes a finding when somebody shows it is reachable, and a bug when the code is not meant to behave that way. Nothing else matched.
seen: no matching selector, so this is its shape
not answered here: Whether anything here is reachable, and whether it is a bug rather than a decision. Presence is not proof; absence is not clearance.

So is it safe to use?
Unknown, and this sheet will not pretend otherwise. What it can say is narrow and true: which hazard shapes are present (3), which behaviours have been demonstrated (a placard that says confirmed), and which classes the code does not match at all. What it cannot say is whether any of them is reachable, whether the economics make it exploitable, or whether a hazard is a bug or a deliberate choice - intent is not in the bytecode.
seen: no matching selector, so this is its shape
not answered here: The honest one: the state of the owner key, what you have approved, and what happens to the contract after this block.

What is this?
It is a contract verified as ClausTokenDealEscrow on mainnet. Everything below is read from the bytecode it exposes, not from its docs.
seen: no matching selector, so this is its shape
not answered here: Whether it is any good, and who wrote it.

Who is in charge?
No owner or admin function is exposed here. Either nothing is configurable, or the power sits behind a proxy or another contract this scan could not follow.
seen: no matching selector, so this is its shape
not answered here: Which of those two it is.

Can anyone else move my balance?
Only with your approval: this is an allowance-based token, so the standing risk is what you have approved, not what the contract can do on its own.
seen: 0x23b872dd transferFrom(address,address,uint256)
not answered here: What you have approved right now - that is state, not bytecode.

BOTTOM LINE

3 of 16 registered hazards are present (HZ-001, HZ-005, HZ-009). That is the fingerprint, not a verdict: somebody still has to read the code, and the sharpest one has already been reproduced against this very contract, which raises it from a shape to a demonstrated behaviour.

BEFORE YOU TRUST IT, CHECK

- Bound the still-valid exit by the same clock as the permissionless trigger, or document which exit
- is authoritative after the window.
- Add a sweep for stray value, or document that it is donated.
- Define the authoritative exit for the overlap, or bound both paths by the same clock.

HAZARDS FOUND

HZ-001 A still-valid action is destroyed by a permissionless trigger in the same block
class 2 ordering CONFIRMED ON THIS TARGET
Two exits are legal in the same block and pay opposite amounts. The transaction that lands first decides, and the losing exit cannot be repaired because the other is already dead from its own clock.
What is at stake: one deal amount, which is the worker's entire payment on the affected deal.
What to do: Bound the still-valid exit by the same clock as the permissionless trigger, or document which exit is authoritative after the window.
Reproduced here: confirmations/HZ-001-c2292af8.json - a rebuild of the verified source and the probes in it passed. Confirming behaviour, not intent.
matched by selectors: 0xe4725ba1 0x7c7a9804 0x82cbf88b

HZ-005 Value arriving outside the accounting has no sweep
class 7 stranded-value CONFIRMED ON THIS TARGET
A contract that pays out only from internal credits accepts forced native value or direct token transfers, counts them in no total, and offers no function to recover them. Accounting stays correct, so nothing breaks and nothing notices.
What is at stake: the stranded amount itself, unbounded by any ceiling.
What to do: Add a sweep for stray value, or document that it is donated.
Reproduced here: confirmations/HZ-005-c2292af8.json - a rebuild of the verified source and the probes in it passed. Confirming behaviour, not intent.
matched by selectors: 0x70b6fbec 0xb12ae89c 0x9b40b785

HZ-009 Two permissionless exits are both legal in one block and pay opposite amounts
class 2 ordering CONFIRMED ON THIS TARGET
Inside one block a stranger trigger and the buyer exit are both valid and settle the deal differently. Block ordering alone decides who is paid, and the loser cannot repair afterwards because the other path is already closed by its own clock.
What is at stake: one deal: full price on one ordering, zero on the other.
What to do: Define the authoritative exit for the overlap, or bound both paths by the same clock.
Reproduced here: confirmations/HZ-009-c2292af8.json - a rebuild of the verified source and the probes in it passed. Confirming behaviour, not intent.
