HAZMAT SAFETY DATA SHEET

0x27182842E098f60e3D576794A5bFFb0777E025d3 (verified as Euler)

Read 854 bytes of deployed bytecode and checked it against 16 registered hazards. Nothing matched, which is not the same as safe.

What this is: It is a contract that delegatecalls, but the pointer to its logic was not found, so anything below may describe only part of what runs.
What matched: Nothing. None of the 16 registered hazards are present in this bytecode.
What that means: Unfamiliar rather than sound. The register is shaped after a small number of projects, so a contract can be perfectly normal and still match nothing. A famous example on this register: The DAO, EtherDelta and Fomo3D all match nothing.

ASSERTION LEVEL: PATTERN MATCH ONLY; CONFIRMATION RUNS ARE SEPARATE
A match is a candidate, not a clearance: this sheet fingerprints a contract against registered hazard shapes, it does not audit it. A clean sheet is not the same as safe.

ANSWERS TO THE USUAL QUESTIONS
read from the selectors this contract exposes, not from its docs. Every answer says what it cannot tell you.

Did you find any vulnerabilities in the contract?
No - and that means less than it sounds. 16 hazard shapes were checked and none of them are here. The register is small and shaped after a handful of projects, which is why The DAO, EtherDelta and Fomo3D all match nothing on it too. Missing a shape is not evidence of soundness; it is evidence that nobody has written this contract down yet.
seen: no matching selector, so this is its shape
not answered here: Whether anything here is reachable, and whether it is a bug rather than a decision. Presence is not proof; absence is not clearance.

So is it safe to use?
Unknown, and this sheet will not pretend otherwise. A clean scan means the register has nothing to say about this code, which is not the same as the code being sound. The only real answer comes from reading it, or from somebody who has.
seen: no matching selector, so this is its shape
not answered here: The honest one: the state of the owner key, what you have approved, and what happens to the contract after this block.

What is this?
It is a proxy: calls are forwarded to logic held at another address. Everything below is read from the bytecode it exposes, not from its docs.
seen: no matching selector, so this is its shape
not answered here: Whether it is any good, and who wrote it.

Can the rules change under me?
Yes. This is a proxy or it exposes upgrade entry points, so the code that runs can be replaced while the address, and anything you have deposited, stays put. The rules you read today are not guaranteed to be the rules tomorrow.
seen: the scan resolved this as a possible-proxy
not answered here: Who holds the upgrade key, and whether there is a delay before a change takes effect.
related hazard: HZ-011, HZ-012

Who is in charge?
No owner or admin function is exposed here. Either nothing is configurable, or the power sits behind a proxy or another contract this scan could not follow.
seen: no matching selector, so this is its shape
not answered here: Which of those two it is.

BOTTOM LINE
Nothing in this register matched, so it is unfamiliar rather than cleared. 16 hazards were checked; the ones that fired nowhere include reentrancy, ordering and authority shapes. Nothing here says safe.

BEFORE YOU TRUST IT, CHECK
- Find out who can upgrade it, and whether there is a delay.

HAZARDS FOUND
None of the registered hazards are present. That is not the same as safe: the register is shaped after a handful of projects, so this contract may simply be unfamiliar to it.

WHAT WAS READ
a match means the selectors a placard asks about are present. It does not mean reachable, and a clean sheet is not a clearance.
placards checked 16 classes 7 selectors in code 5 the register asks about 0 otherwise unaccounted 5
0x06fdde03 name()
0x734c938f unnamed
0xcab65f01 unnamed
0xe9c4a3ac unnamed
0xffffffff unnamed

NOT CHECKED AT ALL
- resolution is best effort: unknown proxy patterns, diamond facets and beacons pointing at beacons
- are labelled not followed
- reachability
- economic preconditions
- state at any particular block
- source-level reasoning
- anything not covered by a placard
